

Technical Abstract Template

[Project title]

[Insert project visual,
workflow image, or
prototype screenshot]

[Team name] | [Institution] | [YYYY-MM-DD]

The project starts from one clear technical problem

Context

- [Biological or bioinformatics setting]
- [Who is affected]
- [Why now]

Frame the need

Gap

- [Current limitation]
- [Data, model, workflow, or usability barrier]
- [Evidence for the gap]

Make the problem concrete

Goal

- [Measurable objective]
- [Expected technical output]
- [Success criterion]

Define the target

The proposed solution links input, method, and decision

Core claim: [One sentence explaining why this route is technically credible.]

Data and workflow are organized for reproducible evaluation

Step	Input	Processing	Output
1	[Dataset]	[QC / filtering]	[Clean data]
2	[Features]	[Model / statistics]	[Scores]
3	[Benchmarks]	[Validation]	[Metrics]
4	[User test]	[Demo / feedback]	[Use-case evidence]

The main method should be understandable in one slide

Method principle

- [Explain the core idea without implementation clutter]
- [Name the model, algorithm, database, or statistical method]
- [State the input-output relationship]

Evaluation design

- Baseline: [comparison method]
- Metric: [AUC/F1/runtime/usability/etc.]
- Validation: [cross-validation, benchmark, case study]

The prototype turns the method into a usable output

[Insert screenshot, architecture
image, or demo capture]

User-facing behavior

- Interface or command: [how users run it]
- Output view: [what users receive]
- Deployment state: [demo / repository / platform link]
- Reliability note: [what has been tested]

Key results show both performance and meaning

Performance

[Metric / figure]

[What the audience is seeing]

What improved

Validation

[Comparison / case]

[Why the evidence is reliable]

Why it holds

Use case

[Screenshot / example]

[Why this matters to users]

Where it applies

Innovation should be stated as specific technical advances

Data

[Novel data integration, curation, annotation, or benchmark]

Evidence source

Method

[Algorithmic, statistical, workflow, or model improvement]

Technical logic

System

[Platform, automation, visualization, usability, or deployment contribution]

Practical delivery

Application value depends on adoption, not only metrics

Users

[Researchers, clinicians, students, or industry users]

Value

[Faster analysis, better interpretation, lower cost, or improved reproducibility]

Limits

[Data, model, validation, safety, or usability limits]

Next

[Concrete next development step]

The final message connects problem, method, and evidence

[One sentence that the judges should remember.]

Solved

[Problem]

Need

Built

[Method / system]

Logic

Proved

[Evidence / result]

Credibility
